

John's Plumbing Services

How to read the wireframes?

These are deliberately grey. Wireframes exist to settle three questions before a single colour is chosen: what goes on each page, in what order it appears, and how much weight each block carries. Arguing about a shade of blue while the structure is still undecided wastes everybody's time.

- Grey bars stand in for body copy. The number of bars indicates roughly how much text belongs there.
- Boxes with a cross through them are images. The caption inside names the srcset widths that will be supplied.
- Red circles are annotation markers. Each one is explained in the table beneath its wireframe.
- Red text in angle brackets names the HTML element that will be used for that block.
- Widths are described in em, matching the media queries in `css/style.css`. 48em is 768px at the default browser font size.

Wireframe	Page	Viewport	Breakpoint band
01	Home	1280px	64em and above
02	Home	375px	below 48em
03	About	1280px	64em and above
04	Services	1280px	64em and above
05	Gallery	1280px	64em and above
06	Gallery	375px	below 48em
07	Contact	1280px	64em and above
08	Booking	1280px	64em and above
09	Breakpoint behaviour	all	36 / 48 / 64 / 80em
10	Site map	n/a	n/a

Wireframe 01 Home page, desktop

The home page has one job: convince a visitor within five seconds that this business is real, licensed and reachable, then send them to the booking form. Three-column card grids appear from 64em upwards.

01 Home page - desktop (>= 1024px / 64em)

Three-column card grids. Hero splits into a 48% text column and a 52% image column.

Annotations

#	Block	Mark up used	Why it is built this way
1	Sticky header	<header> + <nav> +	Logo, business name and six navigation links. The header stays pinned while the page scrolls, so the booking link is always reachable. The booking link is styled as a button because it is the primary action.

#	Block	Mark up used	Why it is built this way
2	Hero	<section class="hero"> with <h1> and <figure>	48% text column, 52% image column. The only <h1> on the page. The image uses srcset at 480w, 800w and 1200w with fetchpriority="high" because it is above the fold.
3	Emergency notice	<aside>	Tangential to the main flow, so <aside> rather than <section>. Red is used here and nowhere else on the site, which keeps the signal meaningful.
4	Service cards	<section> containing three <article> elements	Each card is self-contained and would still make sense lifted out of the page, which is exactly what <article> means. Three columns at 64em, two at 48em, one below.
5	Process steps	with styled counters	An ordered list because the steps genuinely happen in sequence. The numbers are generated by CSS counters rather than typed into the markup.
6	Testimonials	<figure> + <blockquote> + <figcaption> + <cite>	<blockquote> marks the quoted text; <cite> names the source. Dates are wrapped in <time datetime="..."> so they are machine readable.
7	Closing call to action	<section class="cta">	Full-bleed navy band. Every page on the site ends with one of these, pointing at booking.html.
8	Footer	<footer> with <address>, <dl> and <nav>	Four columns at 64em. <address> is the correct element for the site owner's own contact details; <dl> pairs each opening-hours label with its value.

Wireframe 02 Home page, mobile

The same HTML in the same order, flowing into a single column. Nothing is hidden or reordered; only the number of columns changes.

02 Home page - mobile (< 768px / 48em)

Everything collapses to one column. Navigation hides behind the MENU button.

Annotations

#	Block	Mark up used	Why it is built this way
1	Collapsed navigation	checkbox + <label> + <nav>	The menu is driven by a visually hidden checkbox and a label styled as a button. CSS uses: checked to reveal the list (no JavaScript). The checkbox is clipped rather than display: none so it stays keyboard focusable).
2	Hero, stacked	same markup as desktop	Text first, then the image. The browser selects the 480w file from the same srcset, which is roughly a fifth of the bytes of the desktop file.
3	Buttons	.button--primary / --ghost	Full width and stacked below 36em so they are easy to hit with a thumb; they sit side by side from 36em upwards.
4	Cards, one per row	.card-grid	grid-template-columns: 1fr. The card order matches the desktop order exactly.
5	Steps, stacked	.steps	The numbered circle sits to the left of each step rather than above it, which keeps the vertical run short.
6	Footer, one column	.site-footer__grid	One column below 36em, two from 36em, four from 64em.

Wireframe 03 About page, desktop

About pages fail when they are one long paragraph. This one is broken into five scannable blocks, each answering a question a nervous customer actually asks.

03 About page - desktop

Page-head banner with breadcrumb, a 50/50 text-and-image split, then a four-card team grid.

Annotations

#	Block	Mark up used	Why it is built this way
7	Page head and breadcrumb	<section class="page-head"> + <nav> +	Every inner page opens with this banner. The breadcrumb is a <nav> containing an , with aria-current="page" on the final item. The separator is drawn in CSS so screen readers do not read it aloud.
8	Story split	.split — text + <figure>	Two equal columns from 48em. The photograph carries a <figcaption>, which turns a decorative image into evidence.
9	Team grid	four <article> elements	Four columns at 64em, two at 48em, one below. Each person is an <article> because each profile stands alone.
10	Credentials accordion	<details> and <summary>	Native expand and collapse with no script. Used here because most visitors will skip the insurance detail, but the ones who want it really want it.

Wireframe 04 Services page

The commercial heart of the site. Six services, each priced, plus a summary table for people who only want the numbers.

04 Services page - desktop
Jump navigation, six service articles with anchor ids, and a four-column price table.

Page 8

Annotations

#	Block	Mark up used	Why it is built this way
11	Jump navigation	secondary <nav> with anchor links	Links to #leak-detection, #geysers and so on. A visitor who came for one service does not have to scroll past five they do not need. scroll-padding-top stops the sticky header covering the target heading.
12	Service article	<article id="..."> with <h3> and <h4>	Each article carries the anchor id, an indicative price, a description, an "Included" list and a "Not included" list. Stating what is excluded prevents the argument on site.
13	Price table	<table> with <caption>, <thead>, <tbody>	scope="col" on the header cells and scope="row" on the first cell of each row, so a screen reader can announce which column a value belongs to. Below 64em the table scrolls sideways inside its own container rather than breaking the page.

Wireframe 05 Gallery page

Proof of workmanship. Three columns at 64em, two at 48em, one below.

05 Gallery page - desktop

Three-column figure grid at 64em, two columns at 48em, one column below that.

Annotations

#	Block	Mark up used	Why it is built this way
14	Figure grid	<figure> + + <figcaption>	Every photograph has a caption naming the job, the suburb and the date. Images are forced to a 3:2 aspect ratio with object-fit: cover so the grid stays even whatever shape the source photo is. loading="lazy" defers anything below the fold.
15	Supporting aside	<aside>	Explains why jobs are photographed and how consent is handled. It supports the gallery without being part of it, which is precisely what <aside> is for.

Wireframe 06 Gallery page, mobile

One figure per row. Each image is served at 400w instead of 800w, roughly a quarter of the bytes.

06 Gallery page - mobile
One figure per row. Images are capped to a 3:2 box so the grid stays even

Annotations

#	Block	Mark up used	Why it is built this way
16	Stacked figures	.gallery-grid	grid-template-columns: 1fr. The caption sits under the image rather than over it, so nothing obscures the photograph on a small screen.

Wireframe 07 Contact page, desktop

Details on the left at 40%, enquiry form on the right at 60%. Below 64em the two stack, with the details first (a phone user is far more likely to tap “call” than to fill in a form.)

07 Contact page - desktop

40% details column and a 60% form column at 64em. Below 64em the two stack, details first.

Annotations

#	Block	Mark up used	Why it is built this way
17	Contact blocks	<address>	<address> is the correct element for the contact details of the page's owner. The default italic styling is removed in CSS. The emergency block is visually separated and uses the alert colour.
18	Enquiry form	<form> with <fieldset> and <legend>	Two fieldsets ("Your details" and "Your enquiry") so a long form reads as two short ones. Every control has a <label for="..."> matching its id. The subject menu uses <optgroup>; the suburb field offers a <datalist> of suggestions while still accepting any value.
19	FAQ accordion	<details> / <summary>	Four questions that would otherwise arrive by email. Collapsed by default so the page stays short.

Wireframe 08 Booking page, desktop

The conversion page. The form takes 68% of the width; a sticky sidebar takes 32% and explains what happens after the visitor presses submit.

08 Booking page - desktop

Form takes 68% of the width; the sticky sidebar takes 32%. Four numbered fieldsets.

Annotations

#	Block	Mark up used	Why it is built this way
20	Emergency diversion	<aside>	Someone with a burst pipe should not be filling in a form. This block sends them to the phone before they start.
21	Four numbered fieldsets	<fieldset> + <legend>	Contact, property, work required, preferred slot. The radio groups sit inside their own nested fieldsets so the question is announced before the options. Inputs carry autocomplete, inputmode, pattern and min attributes so the browser does the validation work.
22	Sticky sidebar	<aside> with position: sticky	Follows the page as the long form scrolls, from 64em upwards. It collapses beneath the form on smaller screens.

Wireframe 09 Responsive behaviour across the four breakpoints

One stylesheet, four min-width breakpoints. This diagram is the agreement about what changes and, more importantly, what does not.

09 Responsive behaviour - how the grid changes at each breakpoint

One stylesheet, four breakpoints. Content order never changes; only the number of columns does.

Key rule: the HTML is written once, in reading order. The stylesheet never reorders content - it only changes how many columns that content flows into.

Annotations

#	Block	Mark up used	Why it is built this way
—	36em / 576px	Large phones	Buttons move from stacked to side by side; the footer splits into two columns; the hero trust list becomes two across.
—	48em / 768px	Tablets	The hamburger disappears and the navigation becomes a horizontal bar; card and gallery grids go to two columns; paired form fields sit side by side; body text grows to 17px.
—	64em / 1024px	Desktop	Card and gallery grids go to three columns; the hero splits 48/52; Contact becomes 40/60; Booking becomes 68/32 with a sticky sidebar; the footer goes to four columns; the price table stops scrolling.
—	80em / 1280px	Wide desktop	No structural change. Body text grows to 18px, the wrapper widens slightly and vertical padding increases so the page does not feel empty.

Wireframe 10 Site map diagram

Six pages, one level deep. Every page is reachable from every other page through the header navigation and the footer site map.

Annotations

#	Block	Mark up used	Why it is built this way
—	Structure	Flat, two levels	Home sits at level 0; the five other pages sit at level 1. Nothing is more than one click from anything else, which keeps crawl depth shallow and navigation obvious.
—	Anchors, not child pages	services.html#...	The Services page uses in-page anchors rather than six separate child pages. Six thin pages would compete with each other in search results; one substantial page does not.
—	Conversion funnel	booking.html	Home, About, Services and Gallery all end with a call to action pointing at the booking page, which is the single conversion point of the site.
